Explore a smarter home

The Aetheria website helps visitors discover smart home products, explore automation ideas, plan a complete home, and contact the business for a purchase or consultation. This guide describes the features customers can find on the website.

A welcoming homepage

The homepage introduces the brand through a large visual banner and clear routes into the catalogue, whole-home planner, project portfolio, and consultation experience. Visitors can browse highlighted products and move directly into the area that interests them.

Connected home overview

An ecosystem section explains how different automation areas fit into a connected home. Service sections introduce the business offering, while partner-brand displays and testimonials add context to the showroom experience.

Featured products and video previews

Selected products appear on the homepage for quick discovery. A featured video area previews content from the video library, helping visitors learn about products and smart home experiences before making an enquiry.

Design advisory form

A homepage form collects name, email, phone, property type, floor area, project timeline, and a message. It currently displays a submission confirmation on the page; sending this particular form to the business is not connected in the supplied version.

Find the right products

The shop brings the product catalogue into one browsing experience, with controls that help customers narrow a large selection into a useful shortlist.

Product catalogue and category browsing

Customers can browse product cards or open the categories page to explore a particular product group. Catalogue entries provide product imagery and key commercial information, with routes to a fuller product view.

Search by product information

Search helps customers find items using a product name, description, or SKU. The search term can be combined with the other catalogue filters.

Category, protocol, and price filters

Visitors can select a category, choose a communication protocol, and set a maximum price. Products priced on request remain available for enquiry without being treated as ordinary fixed-price products.

Sorting and display options

The catalogue supports newest-first, low-to-high price, high-to-low price, and rating-based sorting. Grid and list layouts let customers choose how to browse. Filter controls adapt to smaller screens.

Quick product previews

Quick view opens a product preview without taking the customer away from the browsing screen. It is useful when checking several products before opening a detailed page.

Clear empty results

If a search or filter combination returns no products, an empty-state message explains the result rather than leaving an unexplained blank area.

Look closer before choosing

Product pages give visitors a more detailed view of the item and the available configuration choices.

Product images and essential details

The detail page presents the product name, imagery, SKU, category context, price information, and rating display. Customers can move between product images and inspect the available supporting information.

Variants and finish choices

Where product data includes options, customers can choose a variant or available colours and finishes. The selected variant can change the displayed price and SKU. Supported product configuration choices can include body and reflector finishes.

Description, specifications, reviews, and FAQs

Separate tabs organise the longer product information. Customers can read the description, examine technical specifications, browse reviews, and view product-related questions and answers.

Review form

A review form collects a name, email, rating, and comment. Submitted reviews update the website's saved product information in the current version. The review interface does not establish that the reviewer has made a verified purchase.

Quantity and shopping actions

Customers can choose a quantity, add the selected configuration to the cart, or use Buy Now to move into the cart flow. Wishlist, comparison, and enquiry actions support customers who want to decide later or ask for advice first.

Related product suggestions

A related-products area gives customers additional catalogue items to explore after viewing a product.

Save, compare, and organise

The website includes several ways to keep track of products while deciding what to buy or include in a larger project.

Shopping cart

Customers can add items, change quantities, remove products, and clear the cart. The cart page brings the selection and amount together before opening the enquiry or purchase flow.

Cart drawer

A compact drawer offers quick access to the current cart from elsewhere on the website. Customers can check their selection without immediately opening the full cart page.

Wishlist

Products of interest can be saved to a wishlist and revisited later. Both a dedicated wishlist page and a drawer provide access to the saved shortlist.

Product comparison

Customers can select products for a comparison screen. Bringing the chosen items together helps them inspect the available product information before settling on a choice.

Remembered selections

Cart, wishlist, and comparison selections are saved in the browser. This helps retain a shortlist when returning in the same browser, although clearing browser data can remove those saved selections.

Action feedback

Short confirmation messages tell customers when actions such as adding an item or submitting a request have been performed. Empty views explain when a cart or saved list has no items.

Customer account and enquiries

Customer features bring contact details and enquiry history into the shopping experience.

Registration and sign-in

The website provides signup and login forms. Registration collects the customer's name, email, phone, password, and optional address. Selected shopping or enquiry actions can prompt sign-in and resume the pending action after a successful login.

Customer account page

The account screen displays saved profile details, including the customer's name, email, phone, address, and membership date. It also provides a sign-out action.

Enquiry history

Customers can view the saved enquiries associated with their email address. This creates a personal place to revisit submitted product or smart home requests.

Quote requests

A customer can request a quote for an individual product or the items in the cart. The form collects contact details, quantity, address, and notes, then displays an enquiry reference.

WhatsApp, email, and phone options

The enquiry window offers different contact channels alongside the quote form. Customers can choose the contact method that suits their question or purchase request.

Password recovery screen

A forgot-password tab accepts an email address and displays a confirmation. The supplied version does not send a password-reset email from this screen.

Purchase and payment options

The product enquiry window also includes a payment option for customers proceeding with a purchase.

Payment details form

The purchase flow asks for name, email, phone, and delivery address. The selected product or cart items are used to calculate the amount shown for the transaction.

Razorpay checkout option

A payment checkout integration is included for a configured gateway. Customers can proceed from the payment tab into checkout and receive success or failure feedback from the flow.

Demonstration payment mode

When live gateway credentials are absent, the purchase flow uses a simulated payment. This demonstrates a successful checkout without transferring money and should be presented as a demo payment.

Purchase reference and confirmation

After a successful payment result, the website displays purchase and payment references. A cart-based purchase can clear the cart after submission.

Invoice email support

The purchase/request flow includes an invoice-email service. Delivery to a customer inbox depends on the business having a working email configuration; a confirmation shown on the website alone does not guarantee that an email arrived.

Dedicated enquiry checkout page

An order-enquiry page provides another entry into the shared enquiry window. Its current text describes an enquiry-only process, while the shared window also contains the payment option.

Build a whole-home plan

The smart home configurator helps customers turn an initial idea into a structured automation plan and an indicative budget.

Property type and floor area

Customers begin by choosing the property type and size range. An exact square-footage field allows a more specific area to be entered.

Room-by-room selection

The planner lets customers adjust counts for living rooms, bedrooms, kitchen, dining, bathrooms, office, cinema, outdoor areas, garage, and other rooms. This gives the plan a closer connection to the layout of the property.

Automation system selection

Customers can select smart lighting, motorised curtains, climate control, security, smart locks, multi-room audio, and whole-home automation. Systems can be added or removed as the plan develops.

Three automation tiers

Essential, Luxury, and Architectural tiers provide different levels of investment. Choosing a tier changes the estimate along with the property, room, and system selections.

Indicative investment range

The results show an estimated hardware amount, installation amount, and overall range. Customers can revisit selections to see how their choices affect the estimate. The amount is a planning guide rather than a final agreed quotation.

Downloadable proposal and design request

The planner can generate a PDF proposal with the selected scope and estimate. Customers can also enter their contact details and send the configuration as a request for a more detailed proposal.

Experience automation and book advice

Interactive demonstrations and consultation options help customers understand what a complete smart home could offer.

Interactive room simulator

Visitors can switch between living room, bedroom, cinema, and terrace settings. The visual experience includes lighting colour and brightness, climate, curtain position, audio, security, doors, and display states.

Scene presets

Presets such as Welcome Home apply coordinated room settings. They demonstrate how several automation elements can change together. The simulator is a website demonstration and does not operate physical devices.

Consultation choices

Customers can request a virtual consultation, an on-site walkthrough, or a smart home design consultation. Each option gives them a different way to discuss their project with the business.

Property and appointment preferences

The consultation form collects contact information, property type, city, size, preferred date, and preferred time. Customers can select areas of interest and add notes about their requirements.

Detailed areas of interest

Consultation choices include lighting and keypads, curtains and shading, whole-home audio, private cinema, climate control, security, energy management, and wiring design.

Consultation reference and PDF receipt

Submission displays a reference and triggers a downloadable confirmation document. The preferred date and time form part of the request; the website does not show live appointment availability or guarantee a reserved slot.

Explore projects and get support

The website includes supporting pages that help customers learn about the business, understand the offering, and find information when they need it.

Solutions and business information

Solutions introduces automation services and use cases. The About page provides business and brand information for visitors who want to understand the company behind the catalogue.

Project portfolio and galleries

Customers can browse the project list and filter by project type. Individual project pages provide a fuller case-study view, with an installation gallery and enlarged image viewing where gallery images are available.

Video library

The video page brings educational and product-related videos into one place. Search and category controls help visitors find relevant guides.

Frequently asked questions

The FAQ page gives visitors a dedicated area for common questions and answers. Product pages also include an FAQ tab for product-related information.

Contact information and message form

The Contact page presents phone, email, address, and business-hour information, together with a message form. The current message form shows an on-screen acknowledgement; its submission is not connected to message delivery in the supplied version.

Policies and easy navigation

Privacy, shipping, terms, and returns pages are available. Shared navigation, category selection, breadcrumbs, footer links, a floating WhatsApp button, and a back-to-top control help visitors move around. Layouts adapt to mobile and desktop screens, and an unknown route shows a not-found page.
